

Client Installation

Setting-Up Workstation

Part II of the installation process is setting-up all local OnyxCeph^{3™} workstations in the **local network** of the Onyx database server. After the server installation was completed and the database server launched either as a program or as a service, workstations (clients) can be installed on any number of clients in the local subnet mask of the server (the computer which hosts the OnyxDBserver) including the server computer itself. The number of concurrent clients (logged in simultaneously) depends on the license and is usually restricted by default to 5.

To install a client, OnyxClientsetup has to be launched locally on the computer. This can be done from a local drive or via network accessing shared server folder

```
\\[SERVER].. \Onyx3server\Install
```

Hint

To install a client, local administrator permissions are required. The computer also needs to match the hardware requirements for the corresponding OnyxCeph^{3™} program version and to be operated by a supported Windows[™] version.

After choosing the installation language, click [Run]. This will launch the [Server Search Tab](#) listing all available database server instances in the local network. Select the correct server and connection type (strongly recommended to choose TCP/IP). Thereafter, define the installation folder for program group OnyxCeph3 and confirm the selection.

After OnyxClientSetup has copied all required client files to this folder, program OnyxCeph^{3™} can optionally be launched. A new program group OnyxCeph_3 can be found in the Windows[™] [Start] menu providing the following entries

- [OnyxAdmin](#)
- [OnyxCeph^{3™}](#)
- [OnyxCeph^{3™} in the Internet](#)

- [OnyxClient Uninstall](#)
- [OnyxHelp](#)
- [OnyxRegister](#)
- [OnyxStat](#)
- [OnyxSync](#)

Optionally, a desktop link OnyxCeph³™ can be created
