📦

included by default

📦

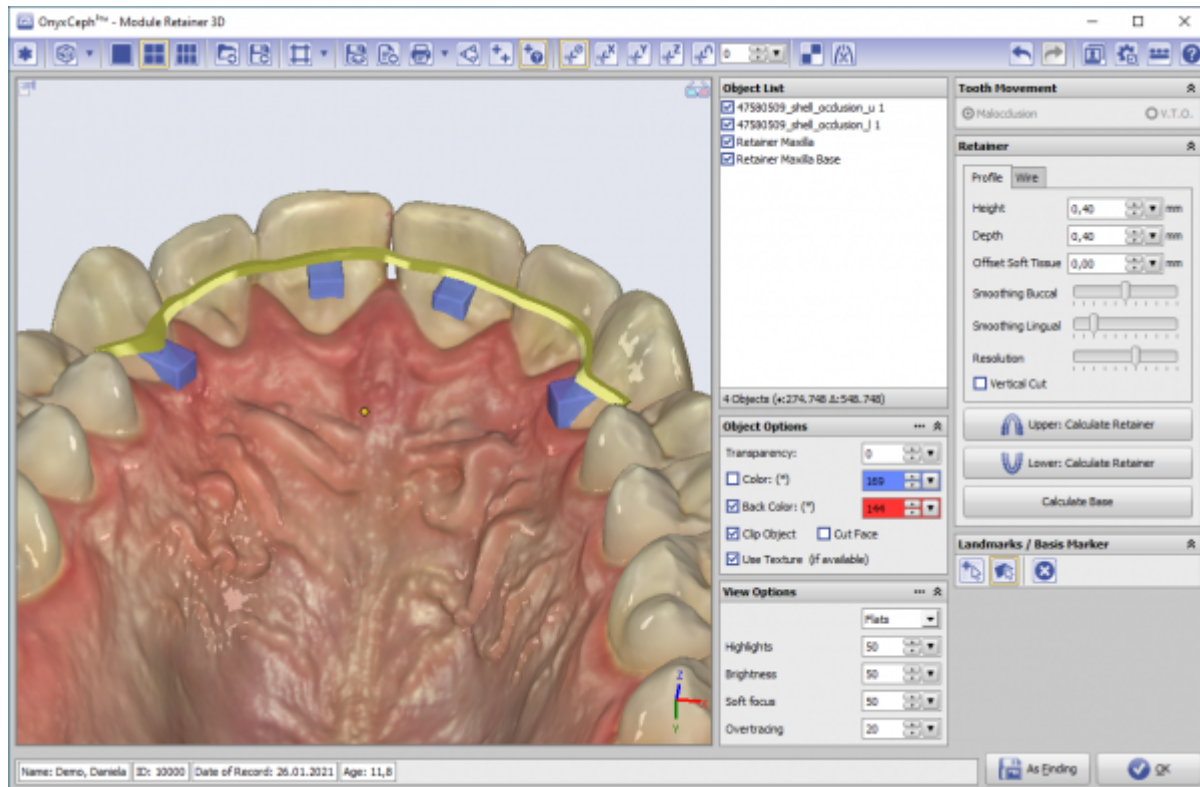

optionally included

Module Retainer 3D can be used to construct virtual retainers based on an unsegmented or setup model created with the V.T.O.3D module.

## First Steps

1. Place three points defining the front point and left/right end of the retainer
2. Set parameters such as height, width and precision
3. Compute the retainer for each jaw
4. Export the retainer as 2D path, 3D object or send it to a service provider
5. Save project
