

# Client Application OnyxSync

The OnyxSync client application is used to synchronize data between two connected Onyx databases. The program is primarily used to transfer selected or all data from the network server to the standalone instance on the notebook, while both databases are in the same subnet.

The program starts from the program group OnyxCeph3 at the local workstation.

## User interface

The screenshot shows the OnyxSync application window. At the top, there are two database selection fields, both set to 'ASUS2'. Below them is a dropdown menu set to 'Image Instruments'. A button labeled 'Daten von links nach rechts' (Data from left to right) is visible. A checkbox labeled 'Nur aktive Patienten verwenden' (Only use active patients) is also present. Below the controls is a table with patient data. The table has columns for patient ID, last name, first name, gender, model number, birth date, additional information, version, attributes, behavior, number of images, number of findings, and a marker. The table contains 15 rows of data, with the 10th row (patient 10097) highlighted.
